ABSTRACT

The Pacification Attitude Analysis System (PAAS) Command Manual is the master document governing utilization of the system. PAAS has been developed to provide the Military Assistance Command Civil Operations and Rural Development Support, Pacification Studies Group (PSG) with an automated means of processing and reporting the results of surveys conducted to determine the attitudes of the Vietnamese people toward pacification, the war, and political, social, and economic development. The system produces reports reflecting the results of these surveys, which are conducted in both the urban and rural areas as part of the Pacification Research Program under the direction of PSG. The PAAS reports are used by the Military Assistance Command Vietnam (MACV), U.S. agencies and Government of Vietnam (GVN) officials at the national and provincial levels in analyzing and evaluating attitudes, and by the Vietnamese government in formulating economic, territorial security, and political plans for pacification.

ACKNOWLEDGEMENTS

The Pacification Attitude Analysis System (PAAS) Command Manual was prepared by the MACV Project Documentation Group, Control Data Corporation (Western Pacific Facility, Sunnyvale Systems Division), Military Assistance Command Vietnam Project. The System Analysis Section and Programming Section of the Military Assistance Command Vietnam Project contributed to the content of the manual. The manual was prepared under Army Missile Command (AMICOM) Contract No. DAAH01-71-C-0009.

PACIFICATION ATTITUDE ANALYSIS SYSTEM
(PAAS)

1 GENERAL DESCRIPTION

This section includes a statement of the purpose of the Command Manual and presents discussions on the application, operation, configuration, performance, and organization of the Pacification Attitude Analysis System (PAAS). A description of the data base and a general description of the system's inputs, processing, and outputs are also included.

1.1 Purpose of the Command Manual

The PAAS Command Manual is designed to meet the requirements of Military Assistance Command Civil Operations and Rural Development Support (MACCORDS), Pacification Studies Group (PSG) staff personnel by describing PAAS data processing procedures.

The material in this Command Manual orients the reader and informs him of system functions, capabilities, and procedures necessary for effective use of PAAS. A glossary of acronyms, abbreviations, and terms with special meanings used within the text of this manual is included in Appendix A.

1.2 System Application.

PAAS was designed to quickly and efficiently process vast amounts of Vietnamese attitude survey data through the use of Automatic Data Processing (ADP) techniques. The system tabulates and stores the responses to the monthly PAAS Questionnaire and extracts and formats data for use in determining nation-wide trends, urban and rural attitudes, and popular reaction to specific events. The reports produced by the system provide guidance to U.S. and GVN agencies engaged in high-level management planning of the pacification program.

1.2.1 System Objectives. The primary objective of PAAS is to automatically process the large volume of data collected in attitude surveys to meet the needs of the Pacification Research Program (PRP), which is under the direction of PSG, and produce reports reflecting the survey's results. This objective of PRP, described more completely in Appendix B, is to survey the attitudes of the Vietnamese people toward subjects of interest to the Vietnamese government in developing pacification plans, and to report the results of these surveys to elements of MACV, to departmental level U.S. agencies, and to GVN officials at the national and provincial levels. The surveys are accomplished using predetermined questions, many of which change from month to month, asked in an unstructured manner during direct interviews with the people. The responses, recorded by the trained Vietnamese interviewer after he has left the respondent, constitute the raw data base for PAAS. This data is processed by the computer to produce the desired reports.

In addition to providing reports reflecting the frequency and distribution of responses to the survey questions, both in raw form and refined form by cross tabulations, PAAS can provide bi-variance and multi-variance matrices of these reports, special one-time queries such as frequency distributions by non-standard cross tabulations, and report results of special surveys requested. The system is capable of providing a wide variety of statistical reports, including graphic portrayals of geographic locations of results gained from matrix analysis, geographic interview locations, and data for trend analysis. PAAS data is correlated with data from other MACV automated systems, such as the Hamlet Evaluation System (HES), to provide the user with flexible report capabilities.

NARA Reference Copy

1.2.2 System Development. The need for public opinion research as an aid to pacification planning was recognized by MACV in September 1968. Sample surveys and related efforts to develop a public opinion polling program were conducted by various agencies, with MACCORDS-RAD taking direct control of the program in April 1969 and subsequently transferring the responsibility for the program to PSG. The development of this public survey program by PSG is described in Appendix B. Development of the data processing system used to tabulate the results of the survey began in early 1969, following PSG's analysis of the test questionnaire designed to obtain rural attitudes toward pacification and security, political, and economic data. Developed in June 1969, the first Pacification Attitude Analysis System (automated system R31) became operational in March 1970. This system was operated and maintained by the MACV Data Management Agency (DMA) for PSG and provided a historical data base of rural survey question/responses.

Modifications were made to the original PAAS in order to make data retrieval capabilities more flexible, and the programming responsibility was transferred from DMA to MACCORDS-RAD Automatic Data Processing (MACCORDS-RAD/ADP) Systems Division in April 1970. Limitations and deficiencies in PAAS, R31, in processing questions and responses, storing desired information, and in providing wide-range and flexible retrieval led to further refinements in system input, computer processing, and system output. A revised PAAS was designed to increase the flexibility of information and reports produced by the system and to remove artificial constraints on the survey methodology. The new PAAS Master File has been expanded to allow for more questions to be asked in each survey, additional and multiple responses to the questions, graduated multiple responses, and use of input data from other automated systems. Program modifications were made to satisfy imposed constraints and meet various processing requirements, such as longer retention of data for future use of mathematical routines to develop models, use of statistical correlations, and use of regression analysis chi square statements to check the validity of various questions, and trend analysis and graphic portrayal capabilities. The medium of PAAS output and the information content of reports were enhanced; output forms were revised to include more flexible cross tabulation reports and compilations of response frequency distributions. Special frequency distribution reports and matrices of the reports regularly produced are also now available from the system to satisfy special requests or one-time queries.

The revised PAAS, automated system R36, was successfully implemented in April 1971 and supplants the former version of PAAS (R31). The operation of PAAS is closely supervised by PSG. Modifications to the new system that are scheduled for implementation in July 1971 include the development of a pre-edit re-run capability, a revised Activity Error Report, the inclusion of weighting factors to produce normalized reports, and the inclusion of report introductory data on PAAS output reports. Additional capabilities such as statistical routines and the automatic plotting of graphs using the CALCOMP plotter, to meet the requirements of PSG, will also be considered.

1.3 System Operation.

Figures 1-1, 1-2, and 1-3 depict the flow of source documents required by the system through the organizations responsible for the preparation and processing of the data. These flow charts illustrate the relationship between the organizations and briefly note the activities of each.

Figure 1-1 illustrates the normal production cycle of PAAS reports, both rural and urban. PAAS Monthly Survey Forms (80-column keypunch worksheets) which contain coded responses to the PAAS Questionnaire are prepared by PRP survey teams in the field and forwarded to PSG in Saigon via Province and Region officials. PSG performs a data review of these forms when they are received from the four Military Regions (MR), and sends the forms directly to DMA for keypunching and verification. PSG also prepares MACV Forms 418 and submits these to

NARA Reference Copy

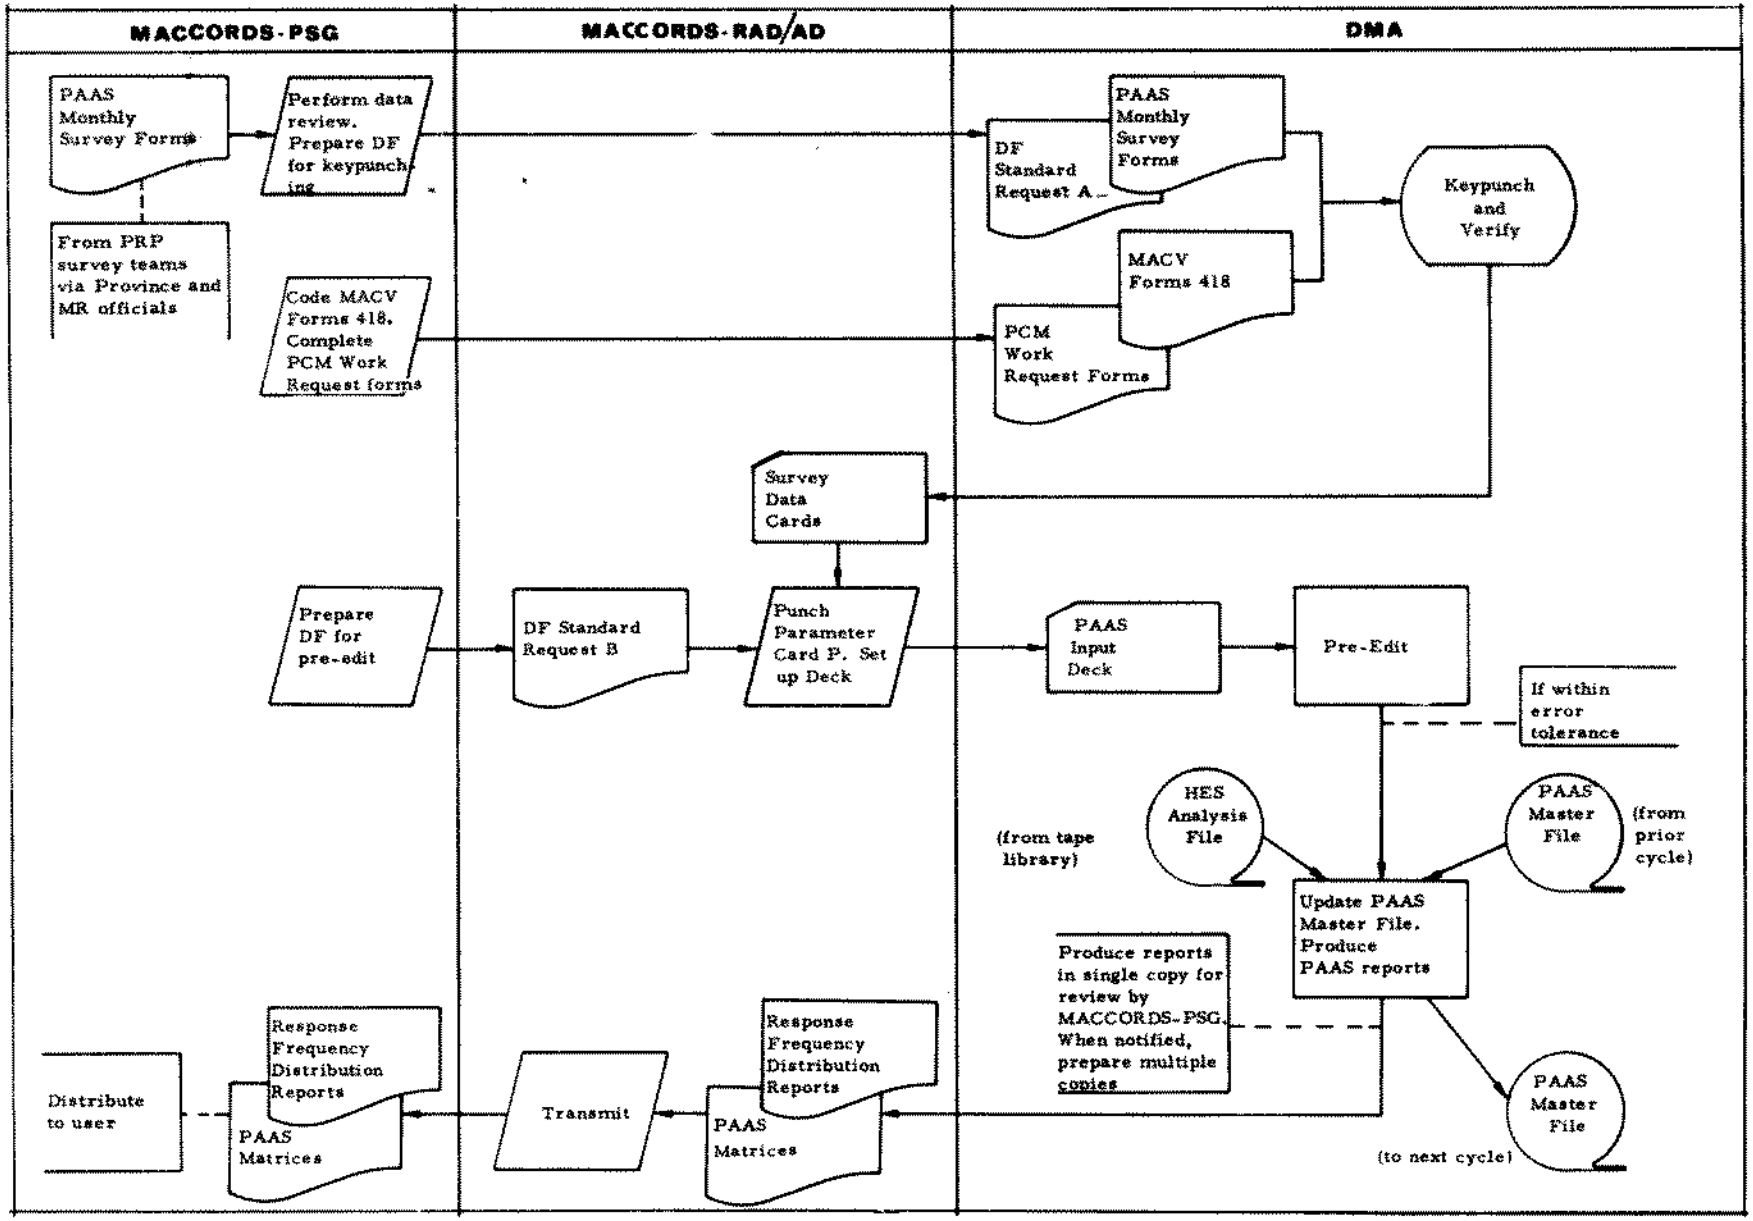

Figure 1-1

PAAS INFORMATION FLOW CHART - RURAL AND URBAN MONTHLY PRODUCTION CYCLES

NARA Reference Copy

DMA for keypunching of other cards required in the input deck: Long Form Question-Response Cards (Card Code A), Long Form Question-Response Locator Cards (L), Short Form or Matrix Question-Response Locator Cards (S), Report Header Cards (H), Report Sequence Control Cards (X), and Key Question Cards (K). The PAAS Monthly Survey Forms and MACV Forms 418 are submitted to DMA with a Disposition Form (DF) 2496, Standard Request A. PSG also sends a DF (Standard Request B) to MACCORDS-RAD/ADP to request preparation of a parameter card (Card Code P). When DMA has keypunched data submitted by PSG, the cards are transmitted to MACCORDS-RAD/ADP, who inserts the parameter card and sets up the deck for computer pre-edit. Normally, as Figure 1-1 illustrates, errors detected by the computer during edit will not exceed pre-defined tolerance levels established for processing, and the edit will be followed by programs that update the PAAS Master File with current month data and produce PAAS reports. The punched cards constituting the input deck, and the source documents, are returned to MACCORDS-RAD/ADP for vault storage for 60 days. The reports are prepared in single copies for approval by PSG; when PSG notifies DMA that the output reports are acceptable, DMA produces multiple copies of the PAAS Response Frequency Distribution and PAAS matrices for distribution to PSG.

The cycle described above is run for rural survey data at the beginning of each month. Rural surveys are conducted by PRP survey teams from the 1st through the 8th, data is collected as explained in Appendix B, and the PAAS Monthly Survey Forms are completed as described in Section 2 of this manual. These forms and the MACV Forms 418 reach DMA on or before the 11th for keypunching and verification, and PAAS Rural output reports are produced by the 16th. Urban survey data is collected in the field (see Appendix B) from the 1st through the 21st of the month, and the Urban PAAS Monthly Survey Forms and MACV Forms 418 are submitted by PSG to DMA for processing by the 25th. PAAS Urban output reports are produced by the 30th of the month.

Figure 1-2 illustrates system operation planned for implementation in July 1971 to accomplish a re-run of pre-edit. When errors detected in the PAAS pre-edit exceed established error tolerances, an Activity Error Report will be produced and transmitted to PSG, along with the source documents, for correction. PSG will code the corrections on new MACV Forms 418 and submit the corrections to DMA for keypunching and verification. PSG will also send a DF 2496 (Standard Request C) to MACCORDS-RAD/ADP, requesting that a parameter card (R) be prepared for re-run of the pre-edit. The keypunched corrections to the deck will be returned to MACCORDS-RAD/ADP, who will insert parameter card R and set up the deck for pre-edit re-run. When all data is error-free or within error tolerance limits, DMA will update the PAAS Master File with the error-free data and generate output reports as previously described. Currently, an Activity Error Report is being produced to indicate errors encountered; to date, however, errors have not exceeded tolerance levels and pre-edit re-run has not been required.

Figure 1-3 illustrates system operation when an aggregation of data is requested to produce reports reflecting one or more month's data. Aggregations are also run upon request, quarterly, and semi-annually and as required thereafter. The aggregated reports contain responses that have been made to selected PAAS questions within the two inclusive dates specified. Responses for up to 50 questions can be aggregated on a quarterly basis, and up to 30 questions on a semi-annual basis. PSG sends a DF 2496 (Standard Request D) to MACCORDS-RAD/ADP to prepare a parameter card (B) for the aggregation run. At the same time, PSG prepares MACV Forms 418 to indicate what questions are desired in the aggregation reports. These forms are submitted directly to DMA, who punches the X and S cards required. The cards are returned to MACCORDS-RAD/ADP, who inserts the parameter card B and sets up the deck for processing by DMA. Output reports are distributed to PSG. Aggregations for rural data can be run between the 16th of the current month and the 16th of the next (following the normal monthly reports production cycle of rural data), and urban aggregations can be run between the first days of two months (following the normal monthly urban production cycle).

System processing is discussed in paragraph 1.6 below, and staff functions related to preparation of system input and handling of output are covered in Section 2. The collection of actual survey data by PRP interviewers in the field in response to the PAAS Questionnaire is described in Appendix B.

1.4 System Configuration.

PAAS is processed by DMA on a System 360 Model 50 computer. Supporting equipment includes standard card punch and card verifier equipment, a card sorter, a card reader punch, disk units, tape drives, and a line printer. The original PAAS utilized the NIPS 360 Formatted File System (FFS). The revised PAAS has been programmed in COBOL for compatibility with input data from other MACV automated systems and ease of computer operations.

1.5 Performance.

PAAS currently consists of seven computer programs which together edit and validate input survey response data; update the PAAS Master File; and generate PAAS reports reflecting the attitudes of rural and urban Vietnamese towards pacification, the war, and social, political, and economic development. The system's programs are discussed in general terms in paragraph 1.6 below, and in detail in the PAAS Program Maintenance Manuals.

1.6 System Organization.

The PAAS reports production processing cycle is conducted during the first half of each month for rural data, and is repeated the latter part of the month for urban data. In each case, raw data extracted from the source documents (PAAS Monthly Survey Forms, MACV Forms 418) is processed within six days.

The first system program initializes the system, sorts the various input cards by card code, and produces separate monthly input stream data on disk to serve as backup copy. Four programs then perform technical edits of the validity of data contained in these cards, cross checking responses and checking for duplication of question numbers. Data, free of errors, is written out on internal files and retained by the system. A sixth program updates the PAAS Master File and extracts report data; the seventh program produces the PAAS reports. Currently, an Activity Error Report is produced to account for errors encountered. A program is being developed to format those records in error on an Activity Error Report which will reflect erroneous question-response data, such as duplicate question numbers and illegal or invalid responses. If there are less than 50 validation errors, processing will proceed. If there are more than 50 validation errors, processing will be suspended. The Activity Error Report will be printed and dispatched to PSG for correction, a re-run of the pre-edit program performed, and, when data is error free or within error tolerance limits, the Master File will be updated and PAAS output reports produced.

The edit and validation portion of PAAS includes comparing or matching data in PAAS against the Hamlet Evaluation System (HES) Analysis File to obtain correct USIDs and dates. The report data extract portion of PAAS processing includes the use of statistical routines to produce a combination of vertical and horizontal questions and responses for Response Combination Frequency Matrices. Plans for future system modifications include the use of population weight factors to produce normalized Response Frequency Distributions.

NARA Reference Copy

1.7 Data Base.

Elements contained in the PAAS data base are indexed in Appendix C. Essentially, the PAAS Master File contains biographic and demographic data and attitude responses to the PAAS Questionnaire as summarized below:

(a) Demographic Data

(1) Hamlet location
(2) Hamlet security
(3) Rural or Urban indicator

(b) Respondee Data

(1) Age
(2) Sex
(3) Ethnic Composition
(4) Religion
(5) Occupation

(c) Political Questions (standard and special, as required) and responses.

(d) Development Questions (standard and special, as required) and responses to these pacification, social, and economic related questions.

(e) Security Questions (standard and special, as required) and responses.

(f) Survey, interviewer, and respondent identifiers.

The two permanent files maintained by the system are the PAAS Master File (PAASA) and the PAASB File. The PAAS Master File records contain raw response data for each respondee to the PAAS Questionnaire. A separate record is created for each respondee interviewed during the month. Up to 58 question/responses are allowed, and they are identified in the file by question number and response value, sequenced in the order in which the questions were asked. Responses to two additional standard questions, considered as the first and second questions of each month's PAAS Questionnaire but which are not asked in the survey, are automatically generated. These are contained in the record as the last two responses, giving a possible total of 60. The two standard questions relate to overall hamlet security and HES security ratings. These questions are automatically generated by PAAS, and responses are obtained by PAAS from the Hamlet Evaluation System (HES) Analysis File. The HES Analysis File is also referenced by PAAS to accurately identify HES USID numbers for survey location purposes. The PAASB File contains the verbal statements of Questions/Responses.

1.8 General Description of Inputs, Processing, and Outputs.

The purpose of system input is to provide a means for the automatic reporting of public attitudes and attitude trends within the Republic of Vietnam (RVN) relative to the war, pacification, and political, social, and economic development. The primary source documents from which PAAS Activity (Survey Data Cards) are punched are the PAAS Monthly Survey Forms completed by the PRP interviewers. These forms contain coded responses to the PAAS survey questions. Additional source document input to the system consists of keypunch worksheets (MACV Forms 418), prepared by PSG, from which various types of cards that determine report content and format are punched to make up the total card deck. The PAAS Monthly Survey Forms and MACV Forms 418 are submitted as input to the system along with an accompanying DF Form 2496

NARA Reference Copy

requesting keypunching and verification. Additional input to PAAS computer programs consists of parameter cards prepared by MACCORDS-RAD/ADP, temporary files created during processing, and data base files: the HES Analysis File, the PAAS Master File, and the PAASB File.

Keypunching and verification of input is accomplished by DMA and processing consists of edit and validation of data, updating of PAAS files, and reports production. The capability for re-run of the edit program is currently under development.

Output consists of eight standard PAAS reports and matrices: a Response Frequency Distribution by Military Region (MR) report for RVN, Response Frequency Distribution by Province reports for each of the four MRs, a Response Frequency Distribution by Cities report, rural Key Question Combination Frequency Matrices, and rural Response Combination Frequency Matrices. These PAAS reports are analyzed by U.S. and GVN agencies to determine and evaluate attitudes of the general populace toward pacification and development in Vietnam and are used specifically by the GVN in planning social, political, and economic development programs for the people.

The relationship of input to output is illustrated in Figures 1-1, 1-2, and 1-3 and detailed descriptions of PAAS input and of system output reports are included in Section 2 of this manual.

NARA Reference Copy

2 STAFF FUNCTIONS RELATED TO TECHNICAL OPERATIONS

This section provides information on preparing input to PAAS, descriptions of system-produced output, and samples of input and output.

2.1 Staff Input Requirements.

Three agencies are responsible for preparing input to PAAS: PSG, DMA, and MACCORDS-RAD/ADP, as described in the paragraphs below. The data base files input to the system programs (refer to paragraph 1.7) are maintained in the DMA tape library. These files are classified CONFIDENTIAL and are handled in accordance with classified handling procedures. The source documents (PAAS Monthly Survey Forms prepared by cadre interviewers and MACV Forms 418 prepared by PSG) are unclassified and require no special handling procedures.

2.1.1 MACCORDS-PSG. The three-men cadre teams who conduct the rural and urban surveys to obtain pacification attitude analysis information, as explained in Appendix B, are responsible for preparing the PAAS Monthly Survey Forms which constitute the major source document input to PAAS. These forms are completed in accordance with instructions contained in paragraph 2.4.1, and then forwarded by the cadre, via regional representatives, to PSG in Saigon for data review. PSG is responsible for performing a data review of the PAAS Monthly Survey Forms as they arrive from the four MRs, and then preparing MACV Forms 418 based upon the monthly input. The MACV Forms 418 (80-column keypunch worksheets) constitute source document input to PAAS and are prepared as described in paragraph 2.4.2. PSG also completes the necessary Punched Card Machine (PCM) Work Request forms (described and illustrated in the PAAS Operations Manual) to accompany the MACV Forms 418 when they are submitted to DMA for processing. Both the PAAS Monthly Survey Forms and the MACV Forms 418 are submitted directly to DMA by PSG along with a Disposition Form (DF) 2496 - Standard Request A (PAAS Keypunch and Verify). This DF is discussed further in paragraph 2.4.3.

PSG is also responsible for preparing similar DFs requesting staff action on the part of MACCORDS-RAD/ADP to initiate PAAS edit runs and aggregation runs. These DFs are explained in paragraph 2.4.4. The system is being modified to include re-run capability. When implemented, if errors exceed tolerance levels established for the system, PSG will be responsible for correcting these errors by submitting new MACV Forms 418 for input to the system. These corrected forms will be completed in the same manner as for original source document preparation, described in paragraph 2.4.2.

2.1.2 DMA. DMA is responsible for keypunching and verifying the PAAS Monthly Survey Forms and MACV Forms 418 received from PSG, and for data processing of the system through production of output reports. The keypunching of PAAS Activity (Survey Data Cards) from the PAAS Monthly Survey Forms, and of other source data cards from the MACV Forms 418 in accordance with the DF Standard Request A received from PSG, is explained in paragraph 2.4.3. No further discussion of DMA's activities in system processing is included in this manual. The reader is referred to the PAAS Operations Manual, which contains this information.

2.1.3 MACCORDS-RAD/ADP. Upon receipt of applicable DFs from PSG, MACCORDS-RAD/ADP is responsible for preparing parameter control cards for input to pre-edit and aggregation runs as described in paragraph 2.4.4. MACCORDS-RAD/ADP prepares the pre-edit parameter card and performs initial deck setup, logging the deck to DMA. When the re-run of pre-edit capability is developed, MACCORDS-RAD/ADP will be responsible for preparing the parameter card required and performing deck set up for processing.

NARA Reference Copy

2.2 Composition Rules.

When preparing source documents, the following conventions have been established to minimize keypunch errors:

(a) The numeric character "0" should be written as "Ø".
(b) The alphabetic character "O" should be written as "O".
(c) The numeric character "1" should be written as "1".
(d) The alphabetic character "I" should be written as "I".
(e) The numeric character "2" should be written as "2".
(f) The alphabetic character "Z" should be written as "Z".

2.3 Vocabulary.

The data elements listed in paragraphs 2.4.3 and 2.4.4 itemize each field of the PAAS source data cards and parameter control cards prepared for system processing.

2.4 Input Formats.

The paragraphs that follow describe the source documents required for input to the system, the source data cards punched from the source documents, and parameter control cards required for system processing.

2.4.1 Source Document - PAAS Monthly Survey Form. The PAAS Monthly Survey Forms are prepared by the cadre interviewers who conduct the rural and urban monthly attitude analysis surveys. Each cadre transcribes the response information he has entered on the PAAS Questionnaire Response Cards (see Appendix B) onto the monthly survey form. As shown in Figure 2-1, the form contains five sets of 80-columns; each set (Columns 11 through 68) contains one respondent's answers to the questions asked in the survey. Each form therefore provides input to DMA for keypunching five 80-column survey data cards.

The PAAS Monthly Survey Forms are completed by the cadre in the following manner. The HES USID number of the hamlet or city in which the survey was conducted is entered in Columns 1-9 at the top of the form. In Column 10, the cadre enters A, B, or C depending on which part of the PAAS Questionnaire he has administered. In the spaces at the top right of the form, the cadre enters the day's date (Ngay thang), the province or city name (Khu vuc), his name (Ten can bo), and his assigned cadre number (So). Columns 11 through 68 contain the question responses, with each column corresponding to a unique question number. The actual responses of the particular respondent are transcribed from the PAAS Questionnaire Response Card, shown in Appendix B. Columns 11 through 68 will contain the letters A-N, depending on the respondent's choice. However, if a multiple response was required for a question, and the cadre did not elicit the required response(s), the corresponding column is left blank. Column 69 is always left blank. In Columns 70-73, the cadre codes the date (year and month) of the survey. In Column 74, he enters the type of survey (R for Rural, S for a Special Rural survey, U for Urban, or T for a Special Urban survey.) The number of the survey for the month is recorded in Column 75; usually this will be a 1 for Rural (the first survey of the month) and a 2 for Urban (the second survey conducted this month). If a Special Rural survey has preceeded the Urban survey, the Urban survey might be the third (enter the number 3) for the month. Columns 76-78 should contain the number that has been assigned the cadre polling this respondent; the cadre enters his number (001-999) as appropriate. In the last two columns, 79 and 80, the cadre

Figure 2-1

PAAS MONTHLY SURVEY FORM

NARA Reference Copy

enters the respondent's number. For rural surveys, this number will always be 01-05, since only five individuals from the same hamlet are interviewed by the cadre. For urban surveys, however, the number of respondents interviewed by the cadre in the urban area will sometimes exceed five.*

The Survey Data Cards punched from the PAAS Monthly Survey Forms by DMA are described in paragraph 2.4.3(a).

2.4.2 Source Documents - MACV Form 418. The MACV Form 418, shown in Figure 2-2, is a standard 80-column keypunch worksheet coded by PSG for keypunching by DMA. The forms are prepared by PSG to add new data to the PAAS files, provide for cross checking and validation of Survey Data Cards, qualify that data to be printed in the output reports, and determine format and content of the output reports themselves. Currently, PSG may request keypunching of six different types of cards by submitting to DMA a MACV Form 418 for each type desired and a Punched Card Machine (PCM) Work Request form (illustrated in the PAAS Operations Manual). Modifications to allow processing of two additional card types (weight factor cards and report introductory data cards) are currently under consideration. The Weight Factor Card will provide the factor for weighting population figures to appear in normalized PAAS reports. Weight factors will be set upon MR or province. The Report Introductory Cards will be required to create pages of remarks, preceding the first pages of PAAS reports, which offer explanatory information concerning the survey. PSG will code these remarks to users of the PAAS reports.

The cards currently punched by DMA directly from the 80-column keypunch worksheets are described in paragraph 2.4.3(b) through (g). Refer to this paragraph for coding instructions for each input card type. Each type is assigned a unique card code, which is entered in Column 80 of the MACV Form 418.

2.4.3 Source Data Cards. Cards are punched by DMA from the PAAS Monthly Survey Forms and the MACV Forms 418 upon receipt from PSG of the source documents. Accompanying the source documents is a DF Standard Request A (PAAS Keypunch and Verify) prepared by PSG to indicate which cards are desired. A sample of this DF is shown in Figure 2-3. In addition to the Survey Data Cards punched from the PAAS Monthly Survey Forms, the following card types are punched from the MACV Forms 418, as listed in the DF:

Long Form Q-R Data - Card Code A
Long Form Q-R Locators - Card Code L
Matrix Q-R Locators - Card Code S
Question Headers - Card Code H
Key Questions - Card Code K
Report Sequence Control - Card Code X

*DMA punches the respondent's number from Columns 79 and 80 of the PAAS Monthly Survey Form, not from the numbers 1-5 preprinted at the left of the form. These merely indicate that five sets of responses can be coded on the form. A cadre who is coding urban responses might wish to change these to 6-10, 11-15, etc. for his own convenience. Similarly, he will have changed the preprinted Columns 01-05 indicating respondent on the PAAS Questionnaire Response Card (see Appendix B) to 06-10, etc.

DISPOSITION FORM

For use of this form, see AR 340-15; the proponent agency is The Adjutant General's Office.

REFERENCE OR OFFICE SYMBOL	SUBJECT Standard Request A - DAR R36 PAAS Keypunch and Verify Priority Desired _____

TO DMA FROM CORDS/PSG DATE CMT 1

1. Request that the following ADP services be provided (as checked):

   ( ) Keypunch and verification of the PAAS Monthly Survey Forms:
   Number of documents _____.
   These documents are classified as "Unclassified".

   ( ) Keypunch and verification of the Long Form Q-R data:
   Number of MACV Form 418 Documents _____.
   These documents are classified as "Unclassified".

   ( ) Keypunch and verification of Long Form Q-R Locators:
   Number of MACV Form 418 Documents _____.
   These documents are classified as "Unclassified".

   ( ) Keypunch and verification of Matrix Q-R Locators:
   Number of MACV Form 418 Documents _____.
   These documents are classified as "Unclassified".

   ( ) Keypunch and verification of Question Headers:
   Number of MACV Form 418 Documents _____.
   These documents are classified as "Unclassified".

   ( ) Keypunch and verification of Key Questions:
   Number of MACV Form 418 Documents _____.
   These documents are classified as "Unclassified".

   ( ) Keypunch and verification of Reports Sequence Control Cards:
   Number of MACV Form 418 Documents _____.
   These documents are classified as "Unclassified".

2. Send source documents and punched cards to CORDS/ADP Production Control upon completion of Keypunch and Key Verification.

DA FORM 1 FEB 62 2496 REPLACES DD FORM 96, EXISTING SUPPLIES OF WHICH WILL BE ISSUED AND USED UNTIL 1 FEB 63 UNLESS SOONER EXHAUSTED.

Figure 2-3

DISPOSITION FORM 2496 - STANDARD REQUEST A

NARA Reference Copy

PAAS Source Data Cards are prepared as described in (a) through (g) below:

(a) Survey Data Cards - These cards are keypunched from the PAAS Monthly Survey Forms (refer to paragraph 2.4.1 and Figure 2-1) as follows:

Card Column	Field	Contents
1-9	USID	Numeric; 9 digits designating the USID in the following manner: 1 Military Region (MR) 2-3 Province 4-5 District 6-7 Village 8-9 Hamlet
10	PAAS Questionnaire Part (Cadre Type)	A, B, or C
11-68	Survey Responses	The actual responses of one particular respondent to the survey questions. Alpha; A-N
69	Blank	
70-73	Date	The date of this particular survey. Numeric; 2 digit year and 2 digit month
74	Type of Survey	Alpha; 1 character. R (Rural survey), U (Urban survey), S (Special rural survey), or T (Special urban survey)
75	Survey Number	The number assigned to this survey for this month. (1 - first survey conducted this month, 2 - second survey, etc.)
76-78	Cadre Number	The unique number identifying the cadre polling this respondent; 009-999
79-80	Respondent Number	The respondent to this particular set of responses; 01-05 for rural survey, 01-99 for urban survey

During processing, these cards are sorted by USID (Columns 1-9), Date (70-73), Survey Type and Number (74-75), Cadre Number (76-78), Cadre Type (10), and Respondent Number (79-80).

NARA Reference Copy

(b) Question Card and Response Card (Card Code A). These cards are punched from MACV Forms 418 containing Long Form Question-Response (Q-R) data. They are required to add a new question and its possible responses to the PAASB File. Whenever a new question is included on the PAAS Questionnaire to be asked in the monthly survey, these cards must be prepared. Note that two cards may be required to input a question or a response, depending on its length.

Question Card Format:

Card Column	Field	Contents
1-70	Verbal Statement of Question	The actual statement of the question. (Two cards may be required; abbreviate if necessary to stay within 140 columns.)
71	Question Card Identifier	Q
72-75	Question Number	The actual question number (fill in zeros on the left if less than 4 digits)
76	Number of Responses Required	The number of responses to the question required from the respondent (at least 1 - no more than 4)
77-78	Total Number of Responses	This is a 2-digit field stating the total number of possible responses to this question (at least 02, no more than 14)
79	Single or Multiple Card Record	C or blank. This field designates a continuation card ('C') if more than 70 columns are needed for the verbal statement of the question. It is left blank when the question requires only 1 card or when it is the first card of a question that require 2 cards. It is coded with a 'C' when it is the second card of a question requiring more than 70 columns.
80	Card Code	A

NARA Reference Copy

Response Card Format:

Card Column	Field	Contents
1-70	Verbal Statement of Response	The actual statement of the response to the question. (Two cards may be required; abbreviate if necessary to stay within 140 columns.)
71	Response Card Identifier	R
72-75	Question Number	The actual question number (fill in zeros on the left if less than 4 digits)
76	Response Value	The actual value of this particular response (an alphabetic character in the range of A-N)
77-78	Blank or Index Code	Leave blank if this question will not be indexed. Otherwise, in the range of plus (+) 9 through minus (-) 9, with zero always designated as +0
79	Single or Multiple Card Record	C or blank. This field designates a continuation card ('C') if more than 70 columns are needed for the verbal statement of the response. It is left blank when the response requires only 1 card or when it is the first card of a response that requires 2 cards. It is coded with a 'C' when it is the second card of a response requiring more than 70 columns.
80	Card Code	A

Continuation cards ('C') for Long Form Questions and Long Form Responses are limited to only one to allow proper sorting. These cards are sorted by Question Number (Columns 72-75), Question/Response (Column 71), Number of Responses Required (Column 76) or Response Value (Column 76), and Single or Multiple Card Record (Column 79).

NARA Reference Copy

(c) Long-Form Q-R Locator Card (Card Code L). These cards, punched from MACV Forms 418, are required in order for the system to know where the response to a particular question is located in the Survey Data Card. The location of a question and its responses is necessary in order to validate the responses given in the Survey Data Card. In addition, cards with Code L are submitted by PSG if it is required to suppress the printing of from one to four responses already punched in the Survey Data Card that pertain to a question in the PAAS files. The format of the Long-Form Q-R Locator Card is as follows:

Card Column	Field	Contents
1-4	Question Number	The actual question number (fill in zeros on the left if less than 4 digits) or DUM1 - DUM4 to suppress printing of from 1 to 4 responses, based on entry in Columns 78-79
5-74	Blank	
75	Survey Type	R (Rural survey), S (Special rural survey), U (Urban survey), or T (Special urban survey)
76	Survey Number	The number assigned to this survey for this month
77	PAAS Questionnaire Part (Cadre Type)	A, B, or C
78-79	Response Sequence Number	Responses are numbered in sequence starting with the number that is one greater than the number of Face Sheet questions asked in the survey this month, and increasing in increments of one. This number is used to place the responses from the Survey Data Card into the proper place in the file, or to indicate response fields to be suppressed (see Columns 1-4)
80	Card Code	L

Cards with Code L are sorted by Survey Type and Number (Columns 75-76), Cadre Type (Column 77), and Response Sequence Number (Columns 78-79).

NARA Reference Copy

(d) Matrix Q-R Locator Card (Card Code S). This card, punched from MACV Form 418, determines the format and content of the Response Combination Frequency Matrix reports output by PAAS. It is used to plot one survey question and its responses against another for a two-dimensional matrix, and presents ten options for a third variable to the matrix. The format of this card is as follows:

Card Column	Field	Contents
1-4	Vertical Question Number	The actual number of the question to be used as the vertical axis of the matrix (fill in zeros on the left if less than 4 digits)
5-8	Horizontal Question Number	The actual number of the question to be used as the horizontal axis of the matrix (fill in zeros on the left if less than 4 digits)
9-12	Third Variable	This field presents 10 options for a third variable to the matrix: (1) Blank - Leaving this field blank results in the selection of producing the two-dimensional matrix. (2) A 4-digit question number - This option results in the printing of the three-dimensional matrix, with each response to this question being the third variable. (3) PROV - This option results in the printing of the three-dimensional matrix, with each province in the nation being the third variable. (4) MIL1 - This option results in the matrix being produced by each province in MR 1, with the MR 1 total. (5) MIL2 - This option results in the matrix being produced by each province in MR 2, with the MR 2 total. (6) MIL3 - This option results in the matrix being produced by each province in MR 3, with the MR 3 total. (7) MIL4 - This option results in the matrix being produced by each province in MR 4, with the MR 4 total. (8) PR followed by a 2-digit province number. This option specifies the province number selected and will produce the matrix by the specific province only.

NARA Reference Copy

Matrix Q-R Locator Card (Cont.)

Card Column	Field	Contents
9-12 (Cont.)	Third Variable	(9) MILR - This option results in the matrix being produced by MR, with a National total. (10) This option is used in conjunction with option (2) and requires a response selection in Column 13. This combination option produces the three-dimensional matrix, with the response specified in Column 13 as the third variable.
13	Selected Response	This is the specific response mentioned in option (10) above
14-75	Blank	
76	Survey Type	R (Rural survey), S (Special rural survey), U (Urban survey), or T (Special urban survey)
77	Survey Number	The number assigned to this survey for this month
78-79	Report Sequence Number	The sequence in which the matrices will appear in the output
80	Card Code	S

Cards with Code S are sorted by Survey Type and Number (Columns 76-77) and Report Sequence Number (Columns 78-79).

(e) Question Header Card (Card Code H). These cards are punched from MACV Forms 418, submitted when PSG wishes to preface a particular question printed in a report with pertinent remarks. A maximum of two header cards are allowed for each remarks statement. Format of the card is as follows:

Card Column	Field	Contents
1-70	Verbal Statement of Header	The actual statement of remarks pertaining to a particular question
71	Blank	
72-75	Question Number	The actual question number (fill in zeros on the left if less than 4 digits)
76-78	Blank	

NARA Reference Copy

Question Header Card (Cont.)

Card Column	Field	Contents
79	Single or Multiple Card Record	C or blank. This field designates a continuation card if more than 70 columns are needed for the remarks. It is left blank when the remarks require only 1 card or when it is the first card of the remarks that require 2 cards. It is coded with a 'C' when it is the second card of the remarks requiring more than 70 columns.
80	Card Code	H

(f) Key Question Card (Card Code K). Up to ten key questions may be selected by PSG for the Key Question Combination Frequency Matrix report per survey or aggregation. The questions selected are keyed against the other survey questions in the output matrix report. The cards, punched from MACV Form 418, are in the following format:

Card Column	Field	Contents
1-4	Key Question Number	The actual number of this question (fill in zeros on the left if less than 4 digits)
5-79	Blank	
80	Card Code	K

(g) Report Sequence Control Card (Card Code X). This card is used to locate the survey question/response in the PAASB File for printing in the Response Frequency Distribution Report. Format of the card, punched from MACV Form 418, is as follows:

Card Column	Field	Contents
1-4	Question Number	The actual question number (fill in zeros on the left if less than 4 digits)
5-74	Blank	
75	Survey Type	R (Rural survey), S (Special rural survey), U (Urban survey), or T (Special urban survey)
76-79	Report Sequence Number	This number controls the sequence of the questions and responses to be printed on the Response Frequency Distribution Report (fill in zeros on the left if less than 4 digits). Starting with the number one greater than the number of Face Sheet questions in the PAAS Questionnaire for this month, it increases by one for each successive response.
80	Card Code	X

NARA Reference Copy

2.4.4 Parameter Control Cards. MACCORDS-RAD/ADP punches control parameter cards for input to the system as requested by PSG in DF Standard Request B for the pre-edit run and in Standard Request D for the aggregation run. The cards are punched, when required, in accordance with instructions on the DF. A third type of parameter card will be required when the re-run capability is added to PAAS. PSG will request this card via Standard Request C (re-run of pre-edit).

(a) Pre-Edit Parameter Control Card (Card Code P). Punched from DF Standard Request B, shown in Figure 2-4, the format of this card is as follows:

Card Column	Field	Contents
1-4	Date	The date of this particular survey. Numeric; 2-digit year and 2-digit month
5-8	Error Tolerance	The minimum number of errors that will make it necessary for error correction and resubmission of corrected data in order to produce the desired reports.
9	Survey Type	R (Rural survey), S (Special rural survey), U (Urban survey), or T (Special urban survey)
10-13	Number of Face Sheet Questions	The actual number of Face Sheet questions on the PAAS Questionnaire for this survey (includes the standard HES overall rating and the security rating questions, which are not asked in the survey, but are program generated)
14-79	Blank	
80	Card Code	P (original request)

(b) Re-run of Pre-Edit Parameter Control Card (Card Code R). This card will be punched when requested by PSG via DF Standard Request C, shown in Figure 2-5, in the same manner as (a) above, except that Column 80 will contain a Card Code of R (to indicate a re-run request) rather than a P.

NARA Reference Copy

(c) Aggregation Run Parameter Control Card (Card Code B). This card is punched when requested by PSG via DF Standard Request D, shown in Figure 2-6. Its format is as follows:

Card Column	Field	Contents
1-4	From Date	The first of two inclusive dates that this aggregation request covers (YYMM)
5-8	To Date	The second of the above mentioned dates (YYMM)
9	Type of Aggregation	R (Rural aggregation run) or U (Urban aggregation run)
10-13	Number of Face Sheet Questions	The actual number of Face Sheet questions asked for this aggregation run (includes the HES overall and security rating), or ØØØØ (see Column 79)
14-78	Blank	
79	By-Pass Response Frequency Distribution Reports	An asterisk (*) is entered to by-pass Response Frequency Distribution reports when requesting a Key Question or Response Combination Frequency Matrix. When requesting only matrix reports, the value in Columns 10-13 must be 'ØØØØ'.
80	Card Code	B

2.5 Sample Inputs.

The PAAS Monthly Survey Form and MACV Form 418, source documents, have been illustrated in Figures 2-1 and 2-2, respectively. Associated input forms (DF Standard Requests) requesting keypunching of source data cards and parameter control cards have been shown in Figures 2-3 through 2-6.

2.6 Output Requirements.

PAAS rural and urban survey reports are produced on a monthly basis during the separate rural and urban reports production cycles. Activity Error Reports will be produced only when errors detected during processing exceed error tolerances established for the system. Aggregated reports can be produced reflecting one or more month's data, if requested, and on a quarterly and semi-annual basis; special matrices combining PAAS data and data from other automated systems, such as HES, can be compiled; and reports reflecting the results of special rural or urban surveys conducted during the month can be produced as requested. PAAS is designed to provide a flexible report capability, and can accommodate special or one-time queries from PSG for special frequency distribution reports by non-standard cross tabulations; special one-time survey reports; data for trend analysis; graphic portrayals of geographic interview locations; graphic portrayals of results gained from matrix analysis; line graphs of question responses for a period of months, produced for graphic portrayals of attitudinal trends; and graphically portrayed models, obtained by averaging the percentages of specific types of responses to a number of questions, and graphing the results over a period of time.

NARA Reference Copy

The capability to provide normalized reports, with data weighted by MR with each MR sample weighing the total sample in proportion with the actual population of the MR, is under consideration for future implementation. The PAAS output reports and matrices are classified For Official Use Only (FOUO) and are treated in accordance with established handling procedures. One copy of each report is produced by DMA for approval by PSG prior to multiple copy reports production. Upon notification from PSG that the reports are acceptable, multiple copies are printed for distribution by PSG to PAAS users. The reports are printed in English.

2.7 Output Formats.

The major PAAS output reports are Response Frequency Distribution reports and Key Question and Response Combination Frequency Matrix reports. The former reflect frequency distributions of responses to survey questions, both in raw form and broken out by required cross tabulations. The latter are two- and three-dimensional matrices of the Response Frequency Distribution Reports. Currently, an Activity Error Report is also produced, but only to account for errors encountered during computer edit. The capability to process error correction data is under development, and the Activity Error Report is in the process of being revised to reflect erroneous question-response data and indicate the error type, such as duplicate question numbers or invalid responses. Following system modifications to accommodate edit re-run, the Activity Error Report will be produced each cycle (rural and urban) if errors detected during processing exceed tolerance levels established for the system. In this event, the Activity Error Report will be returned to PSG for correction prior to updating the PAAS Master File and generating output reports.

2.7.1 Response Frequency Distribution by Military Region. This report reflects how the people surveyed in each MR responded to each question asked in the rural PAAS Questionnaire set for the current month. The total number and percentages of the people to each possible response are broken out by MR. Two sample pages of this report are shown in Figure 2-7, which illustrates the responses to Face Sheet questions 0008 through 0012 asked in the April 1971 survey. As shown on the figures, national totals and percentages are included in the report.

2.7.2 Response Frequency Distribution by Province. Four reports are produced containing the same content as the Response Frequency Distribution by Military Region, but broken out by provinces within each of the four MRs. Figure 2-8 illustrates two sample pages of the Response Frequency Distribution by Province report for provinces in MR 1. Frequency distribution of responses to Face Sheet questions 0008, 0009, and 00010 asked in the April 1971 rural survey are shown. On the report, "N'S" is the number of raw responses obtained in each province to the question. As shown, MR and national totals are also given. Percentages are given for each response, by province, and for MR and the nation.

2.7.3 Response Frequency Distribution by Cities. One report is produced reflecting the total number and percentages of people responding to each response possible to the set of questions contained in the urban PAAS Questionnaire for the current month. The response frequency distribution is broken out for each of the four urban areas surveyed (Danang, Qui Nhon, Saigon and Can Tho) with totals for each. The system has the capability of showing the response frequency distribution for each of 14 urban areas if required. Two sample pages of this report are shown in Figure 2-9, which illustrates the frequency distribution of responses to Face Sheet questions 5015 and 5016 asked in the April 1971 urban survey.

2.7.4 Key Question Combination Frequency Matrix. This report is produced for use by PSG, Research Branch,for purposes of correlating attitude response data in specific areas requested. The matrix matches the responses to key questions selected by PSG to other questions in the monthly rural survey, and may include up to ten key questions. Figure 2-10 consists of two

NARA Reference Copy

sample pages of the Key Question Combination Frequency Matrix produced to reflect responses to Key Question 0007 against other questions asked in the April 1971 rural survey. The figure shows responses to this Key Question (horizontal question or axis), matrixed with those to question 0005 (vertical question or axis), and question 0006 (vertical question or axis). An example of how the matrix is utilized is as follows: Page 1 of Figure 2-10 shows that the largest number of responses (1452) to question 0007 were to B (literate but no formal schooling). Of the people surveyed who responded B to this question, 88 percent live in hamlets where Popular Forces (PF) units are stationed and 12 percent live in hamlets where no PF units are stationed. Correlating responses in two areas such as these (educational attainment and security), PSG is able to formulate indices and detailed attitude analyses of subgroups of the Vietnamese people.

2.7.5 Response Combination Frequency Matrix. This report is produced for use by PSG, Research Branch in correlating a wide range of attitude response data. The matrix is similar to the Key Question Combination Frequency Matrix described above, except that instead of matching the responses to a selected Key Question against the responses to all the other survey questions, any two question/responses are matched, with a third selected variable limiting those responses reflected (e.g., ratings of ARVN by only those respondents who have ARVN units operating in their area). Figure 2-11 shows the Response Combination Frequency Matrix produced to reflect response combinations to Face Sheet questions 0007 and 0008 asked in the April 1971 rural survey, with a third variable based on the response to question 0031. As shown, the matrix applies to those responses given by interviewees who answered question 0031 as stated in 'REMARKS'. Of these, the total raw responses to questions 0007 and 0008 are matched, and the report is further broken down to show column percentages, row percentages, and full percentages.

2.8 Sample Outputs.

Figures 2-7 through 2-11 illustrate sample pages of the PAAS output reports and matrices discussed in paragraphs 2.7.1 through 2.7.5. None of these figures contain classified information.

2.9 Utilization of System Output.

The Response Frequency Distribution by Military Region is produced for use by MACV Command, all MR DEPCORDS, PSG Field Evaluators and Research Branch personnel, MACV and MACCORDS staff personnel, and other U.S. agencies. Four copies go directly to the Office of the President of the Government of Vietnam. The Response Frequency Distribution by Province Reports are produced for use by the same agencies and individuals as noted above, including the Province Senior Advisors, provincial staff, and MR staff of each MR. The Key Question Combination Frequency Matrix (Rural) and the Response Combination Frequency Matrix (Rural) are produced for use by PSG. DEPCORDS/MACV uses the reports in preparing a monthly communique to various Washington agencies highlighting the current attitudes of the Vietnamese people regarding security, economic, and political questions. These same attitudes are presented in greater detail to the Mission Council and COMUSMACV. The Office of the President of the Government of Vietnam uses the data in making decisions pertaining to national policy. The DEPCORDS for the four Military Regions use the reports to evaluate the success of the programs for which they are responsible, and to ascertain the desires of the Vietnamese people for new or modified programs and policies. The PSG Field Evaluators use the reports to keep current on the attitudes and trends in their particular MR. PSG Research Branch personnel use the reports to provide detailed analysis and to formulate indices. PSG also uses the reports as a basis for presenting important findings, graphically, beyond the scope of the basic Response Frequency Distributions. The reports provide input to the weekly and monthly WIEU (Weekly Intelligence Estimate Update). Key Question and Response Combination Frequency Matrices enable the PSG Research Branch to analyze attitudes of various sub-groupings of the Vietnamese people, in order to determine the location of favorable and unfavorable attitudes and the support or lack of support for the GVN/U.S. programs and policies.

GLOSSARY

This glossary contains definitions of terms, abbreviations, and acronyms used in this manual. Items defined in the glossary are listed in alphabetical order.

Term	Definition
ACofS (CORDS)	Assistant Chief of Staff (CORDS)
ADP	Automatic Data Processing
ARVN	Army of the Republic of Vietnam
COMUSMACV	Commander, United States Military Assistance Command Vietnam
CORDS	Civil Operations and Rural Development Support
DEPCORDS	Deputy for CORDS
DF	Disposition Form (Form 2496)
FFS	Formatted File System (NIPS)
FOUO	For Official Use Only
GVN	Government of Vietnam
HES	Hamlet Evaluation System, automated system R70-79
MACV	Military Assistance Command Vietnam
MACCORDS	Military Assistance Command Civil Operations and Rural Development Support
MACCORDS-RAD	MACCORDS, Reports and Analysis Directorate
MACCORDS-RAD/ADP	MACCORDS-RAD/Automatic Data Processing Systems Division
NIPS	National Military Command System Information Processing System (360 FFS)
PAAS	Pacification Attitude Analysis System, automated system R36
PAAS Questionnaire	The questionnaire used in the monthly Pacification Attitude Analysis Surveys conducted in rural and urban areas as part of the PRP.
PCM	Punched Card Machine
PF	Popular Forces
PRP	Pacification Research Program
PSG	Pacification Studies Group (under ACofS CORDS)

NARA Reference Copy

GLOSSARY (Cont.)

Term	Definition
Q-R	Question/Response
RVN	Republic of Vietnam
USAID	United States Agency for International Development
USID	United States Identification. Each component geopolitical level in RVN (hamlet, village, district, province, military region) has a unique U.S.-assigned identification number (USID or, commonly, ID). To afford complete identification of all levels, from region (the highest reporting unit) to hamlet (the lowest reporting unit), a nine-digit USID number is used, as shown below:

4	3	0	0	1	0	4	0	1
region	province		district		village		hamlet	

In the example shown above, the region ID number is 4; the province ID number is 430; the district ID number is 43001; the village ID number 4300104; and the hamlet ID number is 430010401.

UTM	Universal Transverse Mercator. A standard grid system used to identify geographic points of areas. Eight-position UTM Coordinates are used, providing location of geographic points accurate to within 100 meters. UTM coordinates are listed as eight positions. The first two are alphabetic and the last six are numeric.
VC	Viet Cong
WIEU	Weekly Intelligence Estimate Update

PACIFICATION RESEARCH PROGRAM, PACIFICATION ATTITUDE ANALYSIS SURVEY

NARA Reference Copy

NARA Reference Copy

PACIFICATION RESEARCH PROGRAM, PACIFICATION ATTITUDE ANALYSIS SURVEY

The Pacification Studies Group of MACCORDS is tasked with conducting field evaluation of the Pacification Program and other related programs which affect pacification in order to provide DEPCORDS/MACV and ACofS, CORDS, with a current assessment of program status, recommendations for corrective action, and ideas for new programs. To react to the immediate information needs of DEPCORDS/MACV and ACofS, CORDS on specific high-priority areas of interest to which normal administrative channels are unable to respond, PSG exercises staff supervision of the Pacification Research Program (PRP) and administers the automated Pacification Attitude and Analysis System (PAAS), which was designed to support the PRP.

The primary objective of the Pacification Research Program is to survey the attitudes of the Vietnamese people and to report the results of these surveys (by means of PAAS) to elements of MACV and departmental U.S. agencies. These results are also passed to GVN officials at the national and provincial levels. The surveys are accomplished using predetermined questions (the PAAS Questionnaire) asked in an unstructured manner during direct interviews with the people. The responses constitute the automated system's data base, which is processed via the computer to produce the desired reports.

The responsibility for the Pacification Research Program was accepted by PSG in April 1969. Recruiting teams were fielded into the provinces to obtain Vietnamese for a two-week basic training course in survey techniques at USAID Development Center, held in June 1969. After the course in Saigon, the class was divided into small groups for four weeks of field training at the village level. Five training cycles were completed prior to January 1970. As the cadre completed training, PSG assisted each of the four Military Regions (MRs) in their PRP regional polling programs; PSG cadre were assigned as Regional Program Chiefs, and continue to act in this capacity. Each MR program was assigned a U.S. advisor, and was authorized a Vietnamese Regional Chief and Deputy, a three-man Training and Inspectorate Section, an Administrative Section, and a varying number of Provincial Teams. These teams are used for the Pacification Attitude Analysis Survey for ten days each month.

In April 1969, concurrent with the recruiting of cadre survey interviewers, PSG developed a test questionnaire utilizing free-form responses, designed to obtain the widest range possible of rural attitudes. The two main groupings of this questionnaire, which was developed along the lines of the Hamlet Evaluation System (HES) Questionnaire (macro-model, model, sub-model), comprised (1) specific attitudes toward the Pacification Program and (2) general attitudes toward security, and social, political, and economic development. This questionnaire was tested in June 1969 by cadre who spent three weeks conducting the survey in eight provinces. From the results of this survey, a new questionnaire, utilizing multiple-choice responses, was designed with compatibility for computer processing. Surveys to test this questionnaire were conducted the last three months of 1969 and in January of 1970, and results were processed by the automated system, PAAS R31. This interim system was used up to March 1970, with both the automated system and the survey questionnaire undergoing modifications and refinements to the quality and quantity of survey data collected and the reports produced that reflected this data.

The revised automated system, PAAS R36, processes attitude responses to the PAAS Questionnaire used in surveys administered to both rural and urban Vietnamese on a monthly basis by trained cadre interview teams. Upon instruction from ACofS CORDS, PSG develops requests from various mission elements for survey data, refines the questions for surveying, and prepares the final PAAS Questionnaires to be used in the monthly rural and urban surveys.

NARA Reference Copy

PAAS QUESTIONNAIRE

The PAAS Questionnaire is designed to elicit responses from which to gauge nation-wide trends, urban and rural attitudes, and popular reaction to specific events. The questionnaire is prepared each month in two versions, one comprising rural survey questions and the other urban survey questions, and each version consists of three parts (Part A, Part B, and Part C). A list of standard unclassified questions asked every month by all interviewers make up the beginning of each part of the rural and urban PAAS Questionnaires. The Face Sheet questions asked in the May 1971 survey are shown in Figure B-1 (for the Rural questionnaire) and in Figure B-2 (for the Urban) to illustrate the sort of basic data collected each month.* There may be up to 30 Face Sheet questions asked in the monthly surveys, with one response possible to each question. The remainder of the questionnaire consists of a listing of special questions which change from month to month. Actually, six separate lists are prepared: Rural - Part A, Part B, and Part C and Urban - Part A, Part B, and Part C. In comparing Figures B-1 and B-2, which show the standard Face Sheet questions for the May survey, it can be noted that a number of questions are common to both the rural and urban versions, such as those eliciting biographic data from the respondent. Similarly, in the lists of special questions asked each month, a number are included in both the rural and urban versions; further, within each version, a number of these same questions appear in Part A, Part B, and Part C or in two of the three parts. (They may be sequenced in different order on the PAAS Questionnaire itself, but the same question retains its unique question number.)

Most of the special questions asked each month require only one answer, selected from the 2 to 14 (A through N) multiple-choice responses possible. Others require up to four responses from the list of possible answers. While a maximum of 60 response sets can be stored in a Master File record, two responses to PAAS questions concerning HES security ratings and hamlet overall ratings are generated automatically from the HES Analysis File and are not elicited from the interviewee, allowing a maximum of 58 total responses for each questionnaire. For example, if there are 16 Face Sheet questions asked, these would account for 16 responses. Two special questions requiring four responses each would bring the total to 24. Five questions of three responses each would then total 39. Only 19 special questions requiring one response could be included to complete the PAAS Questionnaire.

The complexity of the special questions asked is determined by the quality of the three-man survey cadre team. Part A questions, administered by the most experienced interviewer, are the most complex and require thoughtful consideration on the part of the respondent. A large number of Part A special questions focus upon political development in RVN and current events in other parts of the world. The second best qualified interviewer asks questions from Part B, which involve intermediate complexity. A large number of Part B questions deal with security and law enforcement in the respondent's geographic area, questions that can be answered more upon observation and opinion than upon evaluation and critical judgement. The least qualified interviewer conducts Part C of the survey questionnaire, which includes the least complex questions (many of which require simple "Yes" or "No" answers). The major focus in the Part C question set is upon social and economic development; questions regarding wages and inflation, rural problems such as farming the land, and urban problems such as housing shortages are posed in this survey. As stated previously, all interviewers ask the standard Face Sheet questions.

*These sample questionnaires are labeled Part A. Others labeled Part B and Part C contain the same information.

NARA Reference Copy

The PAAS Questionnaire is classified For Official Use Only (FOUO) due to the sensitive and timely nature of the special questions. For this reason, only the unclassified Face Sheet questions for the May 1971 survey are given as sample illustrations.* However, a general description of the remainder of the questionnaire for May 1971 will serve to illustrate the sort of data collected to determine popular attitudes of the Vietnamese. The Rural PAAS Questionnaire (Part A) included special questions concerning the GVN governmental structure, the war, war veterans, current world events, hamlet security, the Phung Hoang program, and economics. Part B included questions on security, the National Police, Viet Cong infrastructure and terrorist activity in the village or hamlet, curfew restrictions, and political elections. Part C dealt with Popular Forces, ARVN, and U.S. troops; economics; farming the land and the Land to the Tiller Program; and wages and inflation.

Parts A and B of the May 1971 Urban PAAS Questionnaire contained essentially the same questions as those in the rural survey, with intent to determine the attitudes of urban residents toward these areas of interest to the Vietnamese government. Part C included social and economic questions directly geared to urban living conditions, such as wages of business employees and civil servants, inflation and the cost of living, and black market activities.

The PAAS Questionnaire surveys are conducted by trained and experienced cadre who employ a common interviewing technique on both the rural and the urban level, as described below.

PACIFICATION ATTITUDE ANALYSIS SURVEY

Each Regional Deputy for CORDS is provided with three-man PRP province survey teams of trained Vietnamese research cadre who participate in the Pacification Attitude Analysis Survey by obtaining rural and urban responses to the PAAS Questionnaires. The surveys are supervised by PSG and are staffed by 292 Vietnamese research cadre located throughout the country.

Prior to the commencement of the rural survey, the PSG/PRP National Coordinator explains the current month's questions to PRP Regional Coordinators, who in turn discuss the questions with the province team leaders. Twelve hamlets in each province are chosen, by automated random selection, for the survey. The province team leaders then review the questions with other team members. The District Senior Advisor is informed by the Province Coordinator of the survey, and village officials are contacted by the PRP province teams. The interviewers will attempt to conduct their surveys in the first six hamlets that have been chosen for each province. If conditions are such that a visit to a particular hamlet is not possible or practicable, the teams will conduct surveys in one or more of the other six hamlets, as necessary. Essentially the same preparation is made for the urban survey, except that presently this survey is conducted by three-men cadre teams in each of four urban areas: Danang in MR 1, Qui Nhon in MR 2, Saigon in MR 3, and Can Tho in MR 4. Survey teams are planned for additional urban areas in all MRs.

The surveys commence when the cadre teams disperse throughout the hamlets or urban areas to interview the respondents. Respondents for the surveys are selected based on demographic characteristics extracted from official records maintained at the village/hamlet or autonomous city level. Each cadre is responsible for administering only one part of the PAAS Questionnaire. The team leader, the most qualified man, asks questions from Part A, the next most qualified asks the Part B question set, and the least experienced team member conducts the Part C interviews. The rural surveys are conducted for eight days (from the 1st to the 8th of the month) in the six different hamlets selected for each province; urban surveys are conducted

*The PAAS Questionnaire is produced only in Vietnamese. Figures B-1 and B-2 are English translations provided by PSG.

PAAS QUESTIONNAIRE
RURAL SURVEY
MAY 1971
PART A

0003. Hamlet locale.

a. Isolated
b. On lines of communication

0004. Presence of National Police assigned to village.

a. Present
b. Not present

0005. PF unit stationed in or near the hamlet.

a. Present
b. Not present

0006. Organization of the PSDF.

a. Organized and active
b. Not organized
c. Not active, but organized
d. Not organized or active

0007. Education level.

a. No school, illiterate
b. Literacy course
c. Some elementary school
d. Finished elementary school
e. Some secondary school
f. Finished Baccalaureate
g. Some university
h. University degree
i. Graduate study
j. Does not want to respond

0008. Age.

a. Young (18-25)
b. Middle aged (26-40)
c. Old (41-60)
d. Older than 60

0009. Sex.

a. Male
b. Female

0010. Marital status.

a. Married
b. Single
c. Widowed
d. Divorced
e. Separated

0011. Ethnic composition.

a. North Vietnamese
b. Central South Vietnamese
c. Southern South Vietnamese
d. Vietnamese of Cambodian descent
e. Vietnamese of Chinese descent
f. South Vietnamese Montagnard
g. North Vietnamese Montagnard
h. Cham
i. Other

0012. Primary religion.

a. Buddhist
b. Northern Catholic
c. Southern Catholic
d. Hoa Hao
e. Cao dai
f. Protestant
g. Ba Hai
h. Yang (Montagnard)
i. Ancestor worship
j. Other

0013. Income level.

a. Living in want
b. Average
c. Well off

0014. Felt social standing.

a. Upper class
b. Middle class
c. Lower class
d. Does not know
e. Does not want to respond

0015. Is respondent employed?

a. Yes
b. No
c. Does not want to respond

0016. Primary occupation of respondent.

a. Fisherman
b. Merchant
c. Laborer
d. Farm Laborer
e. Tenant farmer
f. Small landowner
g. Large landowner
h. Student
i. Wood gatherer
j. Professionals (doctor, lawyer, teacher, clergy)

0017. For the interviewer. Please circle the response that in your opinion, most closely approximated the credibility that can be ascribed to the respondent's answers.

a. Very confident in the truthfulness of respondent's answers
b. Confident in the truthfulness of respondent's answers
c. Unable to determine from the respondent's behavior the truthfulness of his responses
d. Somewhat doubtful as to the respondent's truthfulness
e. The respondent was obviously untruthful

0018. For the interviewer. Rate the respondent in terms of his apparent confidence in the GVN.

a. Seems totally confident in the GVN
b. Seems to be confident in the GVN but has some reservations about current administration
c. Seems confident in the local GVN officials but in no higher authority
d. Seems confident in the local GVN officials and in a loyal opposition on the national level
e. Seems confident in the local GVN officials but shows some sympathy to the VC
f. Does not seem confident in either local or national GVN officials
g. Does not seem confident in either national or local GVN officials and has apparent sympathy for the VC
h. Is not confident in either national or local GVN officials and shows strong obvious sympathy for the VC
i. Cannot be determined from the behavior of the respondent

0019. ARVN unit stationed in or near the hamlet.

a. Present
b. Not present

5014. Felt social standing.

a. Upper class
b. Middle class
c. Lower class
d. Does not know
e. Does not want to respond

5015. When did respondent move to the city?

a. Born in city
b. Before 1950
c. Between 1950 and partition in 1954
d. (After partition) 1954-1967
e. Since Tet 1968

5016. Primary occupation.

a. Businessman
b. Merchant
c. Skilled laborer
d. Unskilled laborer
e. Student
f. Civil servant or office worker
g. Soldier (not a commissioned officer)
h. School teacher or professor
i. Farmer
j. Other

5017. Credibility of respondent.

a. Very confident in the truthfulness of respondent's answers
b. Confident in the truthfulness of respondent's answers
c. Unable to determine from the respondent's behavior the truthfulness of his responses
d. Somewhat doubtful as to the respondent's truthfulness
e. The respondent was obviously untruthful

5018. Respondent's apparent confidence in the GVN.

a. Seems totally confident in the GVN
b. Seems to be confident in the GVN but has some reservations about current administration
c. Seems confident in the local GVN officials but in no higher authority
d. Seems confident in local GVN officials and in a loyal opposition on the national level
e. Seems confident in local GVN officials but shows some sympathy to the VC
f. Does not seem confident in either local or national GVN officials
g. Does not seem confident in either national or local GVN officials and has apparent sympathy for the VC
h. Is not confident in either national or local GVN officials and shows strong obvious sympathy for the VC
i. Cannot be determined from the behavior of the respondent

PAAS QUESTIONNAIRE (URBAN)
(Page 2 of 2)

NARA Reference Copy

for 18 days (from the 1st to the 21st) in each of the four urban areas. Each cadre interviews only five people a day, as he is expected to conduct an in-depth interview and probe the respondent on each question until he is able to make a proper determination of the appropriate response. The interviewer has memorized that part of the PAAS Questionnaire for which he is responsible, and does not carry the question set with him for reference during the interview. Rather, he accomplishes the interview by asking the predetermined survey questions in an unstructured manner, and makes mental note of the interviewee's responses. These responses are not recorded during the interview. After the interviewer has left the respondent, he records the responses on the PAAS Questionnaire Response Card, described below.

PAAS QUESTIONNAIRE RESPONSE CARD

Figures B-3 and B-4 are English translations of the PAAS Questionnaire Response Cards, printed in Vietnamese, used in the May 1971 Rural and Urban surveys. These sample figures contain the responses to unclassified Face Sheet questions asked on Parts A, B, and C. (The remainder of the card contains FOUO information.) As the figures illustrate, abbreviated responses to the survey questions on the PAAS Questionnaire are printed next to their question number on the right side of the card (DNWTR - Does Not Wish to Respond, DNK - Does Not Know). To the left of these response questions are five columns (01 through 05) corresponding to each of the five respondents interviewed during the day. (The column numbers on the extreme left correspond to blocks on the PAAS Monthly Survey Forms and are used by the cadre when he later transfers responses from the card to the form.)

After the interviewer has left the respondent, he completes the PAAS Questionnaire Response Card as follows. In the blocks numbered 1 through 9 at the top of the card, he enters the HES USID number of the survey location. In the tenth block he enters an A, B, or C to identify that part of the PAAS Questionnaire to which the responses apply. To the top right, he enters the Province name (if a rural survey) or the name of the City (if urban) in which the survey was conducted. Below this, he enters his name. The response portion of the card is completed by entering the response choice (A through N) that most closely approximates the interviewee's response to each question. Each response is entered to the left of the question number, in the column for the respondent. The results of one day's surveys of all five respondents can thus be entered on one PAAS Questionnaire Response Card. At the end of the day, the interviewer transcribes all of the responses which he has entered on the card onto the PAAS Monthly Survey Form, discussed below.

PAAS MONTHLY SURVEY FORM

The process for completing this form, and a sample illustration of the form itself, are included in Section 2 of the Command Manual. One coded form contains five sets of 80 blocks or columns, with numbers corresponding to the column numbers on the extreme left of the PAAS Questionnaire Response Card. At the end of each interview day, the cadre transcribes the survey identification data and the interviewees' responses which he has entered on the card onto a PAAS Monthly Survey Form; these forms serve as source documents (keypunch worksheets) for input to the automated system, PAAS.

Those PAAS Monthly Survey Forms reflecting responses to the rural PAAS Questionnaire surveys are submitted to Provincial officials by the three-man cadre team leaders when the surveys are completed and the teams have returned from the field. Province officials transmit the forms to Regional representatives, who in turn forward the forms to PSG in Saigon for submission to DMA for data processing. Later in the month, the four urban survey teams return to Saigon when their interviews are completed, and the PAAS Monthly Survey Forms which they have prepared are also delivered to PSG for submission to data processing.
